### 1 - Its easy

With Typo3 we now give you the opportunity to update your homepage by yourself. It is important that the collaborators when working on the homepages aren't dependent on where and when the work can take place. That's why it is possible to update the home page directly via an Internet browser.

### 2 - Stability and security of operations

With 4 years of development and more than 4000 solutions Typo3 is one of the most tested web Content Management Systems on the market. It is of course important that the system is robust and reliable, especially since the strain on the system sometimes can be very high. Therefore, Typo3 is exclusively based on tested technologies. And further more, we have chosen to operate from Telia Powercom (Glostrup, Copenhagen), which has 24 hours support with daily backup. During the nationwide power failure in 2003 all our clients' systems were running without interruption!

### 3 - Flexibility

Typo3 is developing rapidly, with programmers all over the world continuously sending in contributions in the form of modules. It is, therefore, always a good idea to contact us to hear whether your special needs can be fulfilled.

### Prices

Typo3 is Open Source and you are therefore not paying for the software but only for the set-up.

**It can't be easier!**

### A quick overview

**Statistics** - The solution is delivered integrated with some of the best statistics systems on the market. With LiveStats your company gets a full overview of visitors and their activities on the website.

**Optimised search engine** - Typo3 is the only solution that makes it possible to optimise every page for the search engines.

**Image manipulation** - There is a built-in image manipulator, which in a simple way and without problems uses images in connection with the website.

**User control and workflow** - It is possible to control which users have access to editing the different parts of the content and who should approve the changes.

**Handling of documents** - Typo3 can handle almost all types of documents and organize them according to the users' wishes.

**CMS/Intranet/Extranet** - Multiple internet, intranet, extranet and sub-divisions can be handled in the same system.

**Shop** - Can be used for presenting, ordering and paying for products with or without integration of credit cards.

### Who we are
